

PTC Announces Deeper Integration of Windchill and Integrity

26.06.2019

At LiveWorx19, PTC presented the extension of the Windchill PLM platform with integrated software management and systems engineering capabilities to seamlessly track product data throughout the product development and manufacturing cycle.

Windchill is expected to provide integrated linking and tracing between product data management capabilities and systems engineering, requirements management, source code management and testing this summer. These features are currently part of Integrity.

The comprehensive view of PLM is intended to enable developers to identify dependencies, track design progress, and track improvements and exceptions. At the heart of the expanded offering, PTC will use the OASIS industry standard OSLC (Open Services for Lifecycle Collaboration) to integrate Integrity Application Lifecycle Management and Systems Engineering into Windchill. PTC also extends PLM linking and tracing with ThingWorx Flow for better collaboration between enterprise systems.

The Integrity Lifecycle Manager and Integrity Modeler products will be renamed later this year.
